Scatter plot showing Predicted vs Observed values for the 1000 Genomes dataset. The coefficient of determination is  $R^2 = 0.823$ . The x-axis is labeled "Observed" and ranges from 0 to 150. The y-axis ranges from 0 to 150. A diagonal line represents the identity line (y=x). Data points are colored by population group: African (red), European (green), East Asian (blue), South Asian (orange), Admixed American (purple), and Unlabeled (grey).

Scatter plot showing Predicted values (Y-axis) versus Observed values (X-axis) for the variable 'number'. The plot includes a diagonal line representing the identity line (y=x). The coefficient of determination is  $R^2 = 0.899$ .

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 150. The y-axis is labeled 'Predicted' and ranges from 0 to 150. A diagonal line represents the identity line (y=x). The data points are colored by density, with a color bar on the right indicating values from 0.00 (dark blue) to 0.05 (dark red). The coefficient of determination is  $R^2 = 0.927$ .

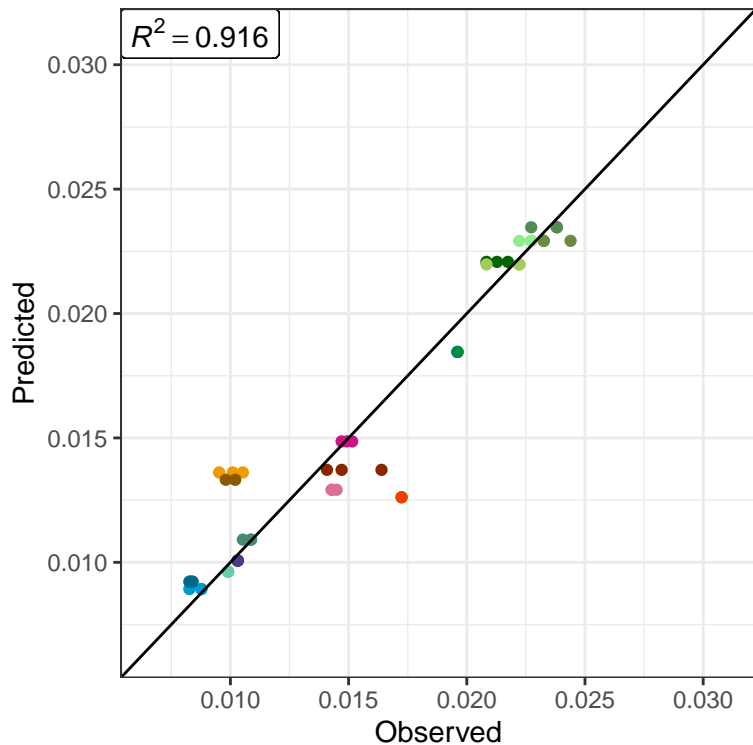

A scatter plot showing the relationship between Observed and Predicted values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black diagonal line represents the identity line (y=x). The data points are colored circles, mostly clustered along the diagonal line, indicating high predictive accuracy. The coefficient of determination is  $R^2 = 0.957$ , displayed in the top left corner.

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 150. The y-axis is labeled 'Predicted' and ranges from 0 to 150. A solid black line represents the identity line (y=x). The coefficient of determination is  $R^2 = 0.919$ . Data points are colored by density, with a color bar on the right indicating values from 0.00 (dark purple) to 0.07 (yellow). The plot shows a strong positive correlation, with most points clustered near the identity line.

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black diagonal line represents the identity line (y=x). The data points are colored and clustered into several groups: blue (bottom-left), purple, pink, orange, brown, green, light green, and dark green (top-right). The coefficient of determination is  $R^2 = 0.959$ , indicating a very strong positive correlation.

A scatter plot showing the relationship between Observed values (x-axis) and Predicted values (y-axis). The x-axis is labeled "Observed" and ranges from 0 to 150, with major ticks at 50, 75, 100, and 125. The y-axis is labeled "Predicted" and ranges from 0 to 150, with major ticks at 50, 75, 100, and 125. A solid black diagonal line represents the line of perfect agreement (y=x). The data points are colored and grouped into several clusters: green points (low values, near the line), pink points (mid-range, slightly above the line), orange points (mid-range, below the line), purple points (high values, near the line), and blue points (high values, above the line). The coefficient of determination is  $R^2 = 0.883$ , indicating a strong positive correlation.

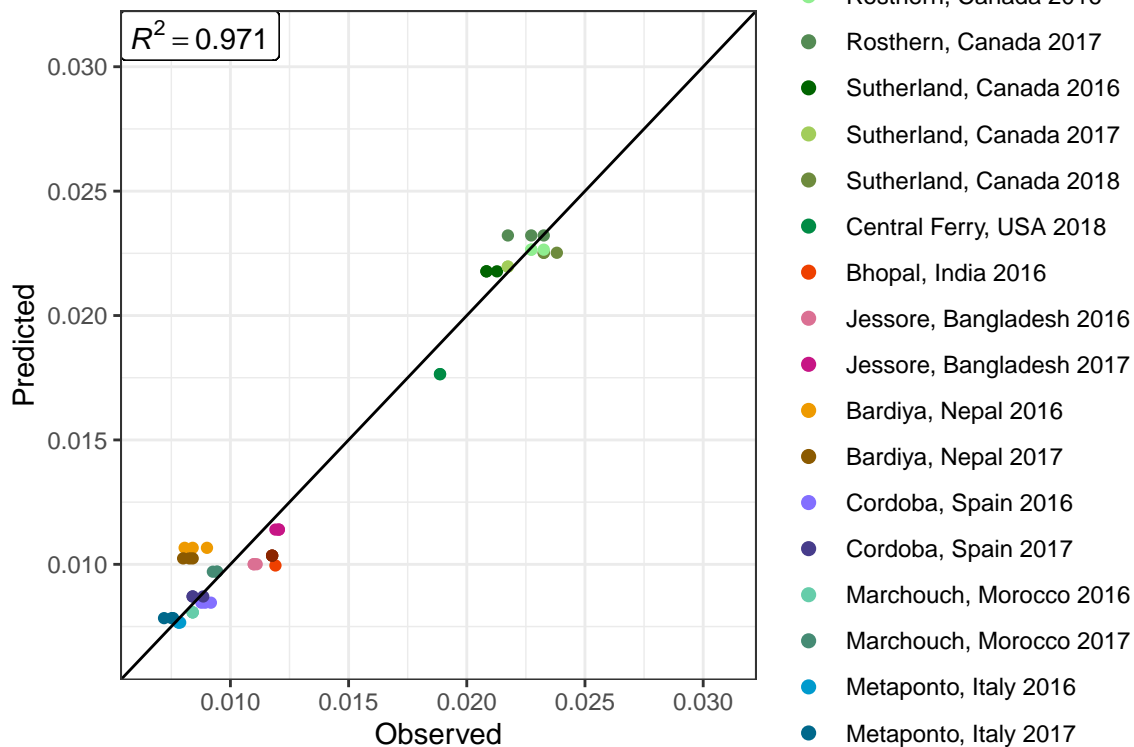

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035, with major ticks at 0.010, 0.015, 0.020, 0.025, and 0.030. A solid black diagonal line represents the line of perfect agreement (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.939$ , displayed in the top left corner.

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 140. The y-axis is labeled 'Predicted' and also ranges from 0 to 140. A solid black diagonal line represents the line of perfect agreement (y=x). The data points are colored and clustered: green points are at the bottom left (low values), brown points are in the middle left, purple points are in the middle right, and blue points are at the top right (high values). The coefficient of determination is  $R^2 = 0.899$ , indicating a very strong positive correlation.

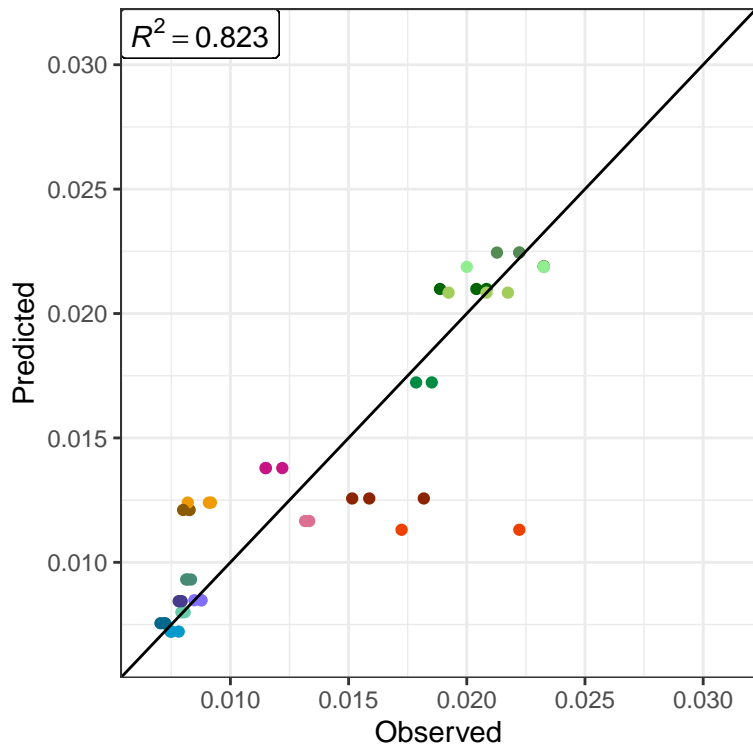

A scatter plot showing the relationship between Observed and Predicted values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black diagonal line represents the identity line (y=x). The data points are colored and clustered, showing a strong positive correlation. A box in the top left corner indicates  $R^2 = 0.952$ .

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 140. The y-axis is labeled 'Predicted' and ranges from 0 to 140. A solid black line represents the identity line (y=x). The plot includes a grid and a text box in the top-left corner indicating  $R^2 = 0.903$ . Data points are colored by density, with a color bar on the right showing a gradient from dark green (low density) to dark red (high density). Most points are clustered along the identity line, particularly in the lower range (0-60), with some outliers at higher values.

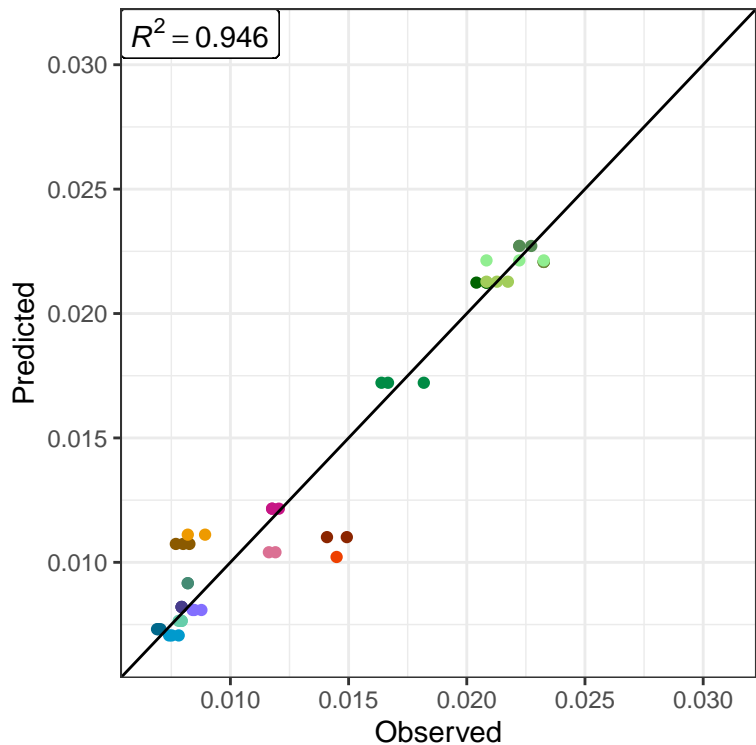

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black diagonal line represents the identity line (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.958$ , displayed in the top left corner.

Scatter plot showing Predicted vs Observed values for the 1000 Genomes Project. The coefficient of determination is  $R^2 = 0.921$ . The data points are colored by population group: African (purple), East Asian (red), European (green), South Asian (orange), and Admixed American (blue). A black diagonal line represents the identity line (y=x). The x-axis is labeled 'Observed' and ranges from 0 to 150. The y-axis ranges from 0 to 150.

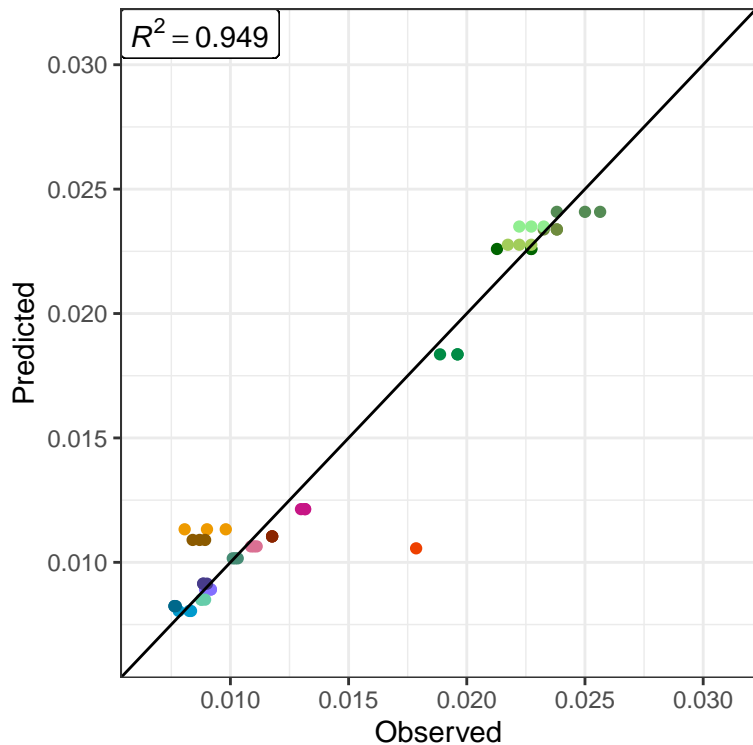

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.010 to 0.030. A solid black diagonal line represents the identity line (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.962$ .

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 140. The y-axis is labeled 'Predicted' and ranges from 0 to 140. A diagonal line represents the identity line (y=x). The coefficient of determination is  $R^2 = 0.898$ . Data points are colored by density, with a color bar on the right indicating values from 0.00 (dark purple) to 0.05 (dark blue). The plot shows a strong positive correlation, with most points clustered around the identity line.

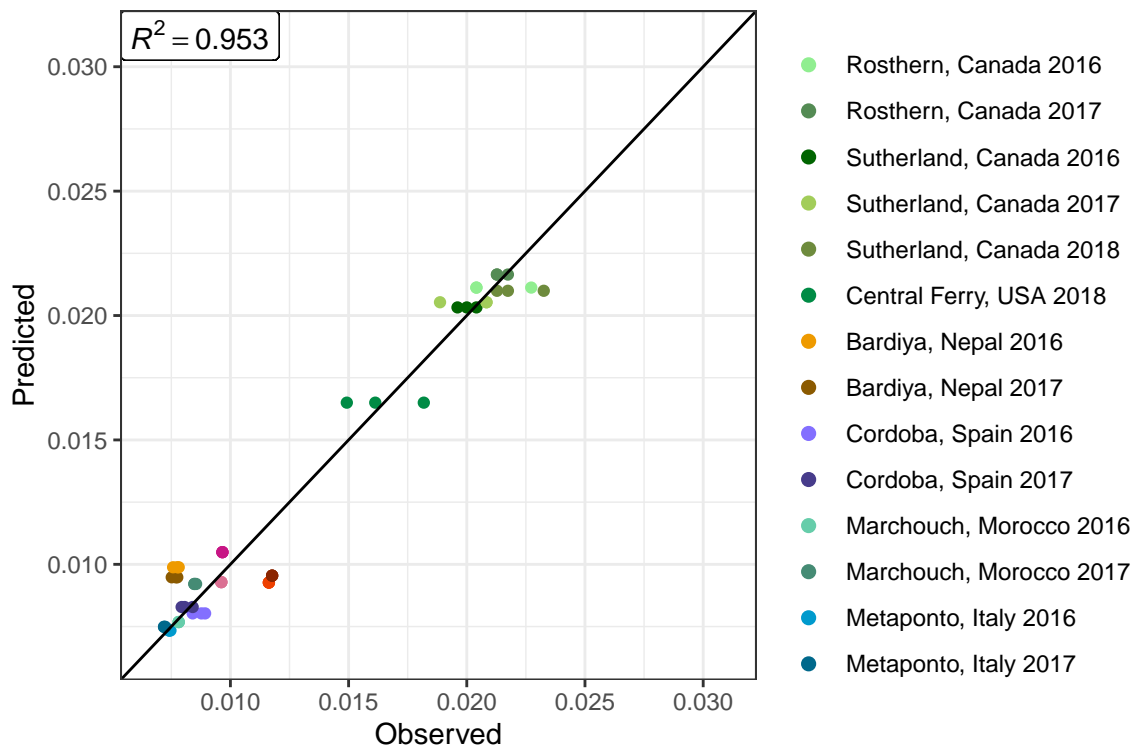

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035, with major ticks at 0.010, 0.015, 0.020, 0.025, and 0.030. A solid black diagonal line represents the identity line (y=x). The data points are colored and clustered: blue (bottom-left), orange (bottom-left), purple (bottom-left), green (bottom-left), pink (bottom-left), brown (bottom-left), yellow (bottom-left), red (bottom-left), light green (middle-right), dark green (middle-right), and light blue (middle-right). The coefficient of determination is  $R^2 = 0.964$ , indicating a very strong positive correlation.

A scatter plot showing the relationship between Observed values (x-axis) and Predicted values (y-axis). The x-axis is labeled "Observed" and ranges from 0 to 150. The y-axis is labeled "Predicted" and ranges from 0 to 150. A solid black line represents the identity line (y=x). The coefficient of determination is  $R^2 = 0.908$ , indicating a strong positive correlation. Data points are colored by density, with green points at the lower end and blue points at the higher end. Most points are clustered near the identity line, with a few outliers at higher values.

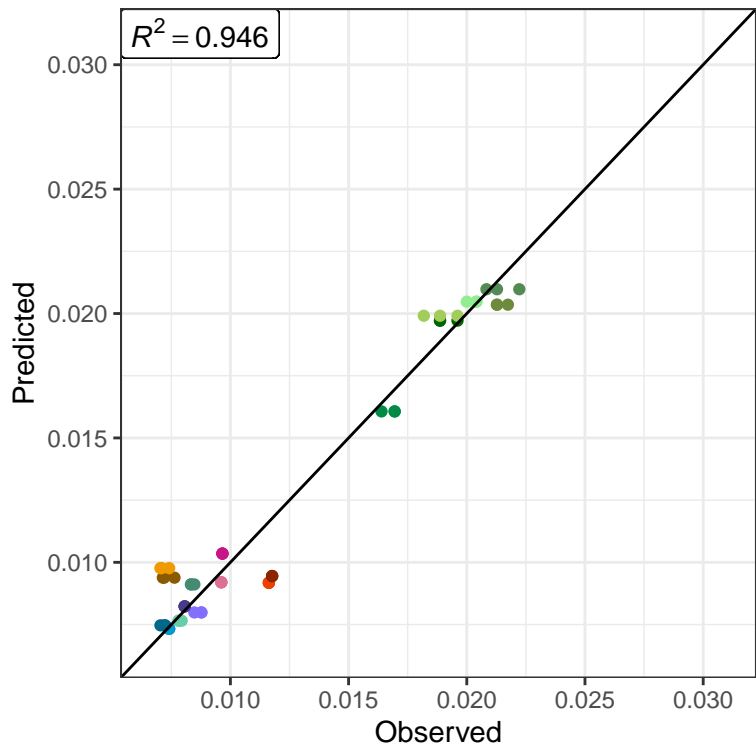

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black diagonal line represents the identity line (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.953$ .

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 150. The y-axis is labeled 'Predicted' and ranges from 0 to 150. A solid black line represents the identity line (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.907$ .

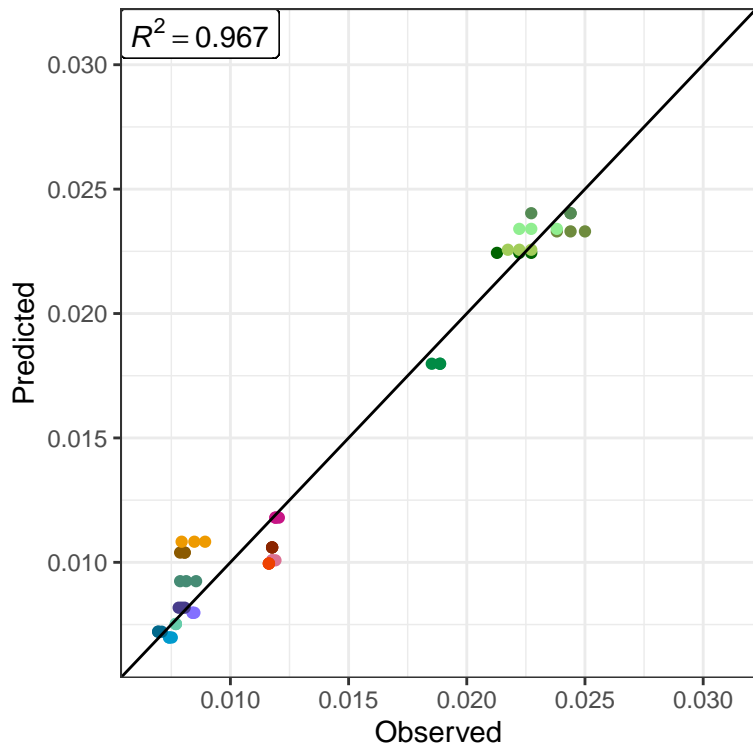

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035, with major ticks at 0.010, 0.015, 0.020, 0.025, and 0.030. A solid black diagonal line represents the line of perfect agreement (y=x). The data points are colored circles, with colors corresponding to the 'Category' in the legend: Blue, Green, Yellow, Orange, Brown, Purple, Pink, and Grey. The points are tightly clustered around the diagonal line, indicating a high correlation. In the top-left corner, a box contains the text  $R^2 = 0.946$ .

A scatter plot showing the relationship between Observed values (x-axis) and Predicted values (y-axis). The x-axis is labeled "Observed" and ranges from 0 to 150. The y-axis is labeled "Predicted" and ranges from 0 to 150. A solid black line represents the identity line (y=x). The coefficient of determination is  $R^2 = 0.883$ . Data points are colored by density, with a color gradient from green (low density) to dark blue (high density). The points are clustered around the identity line, indicating a strong positive correlation.

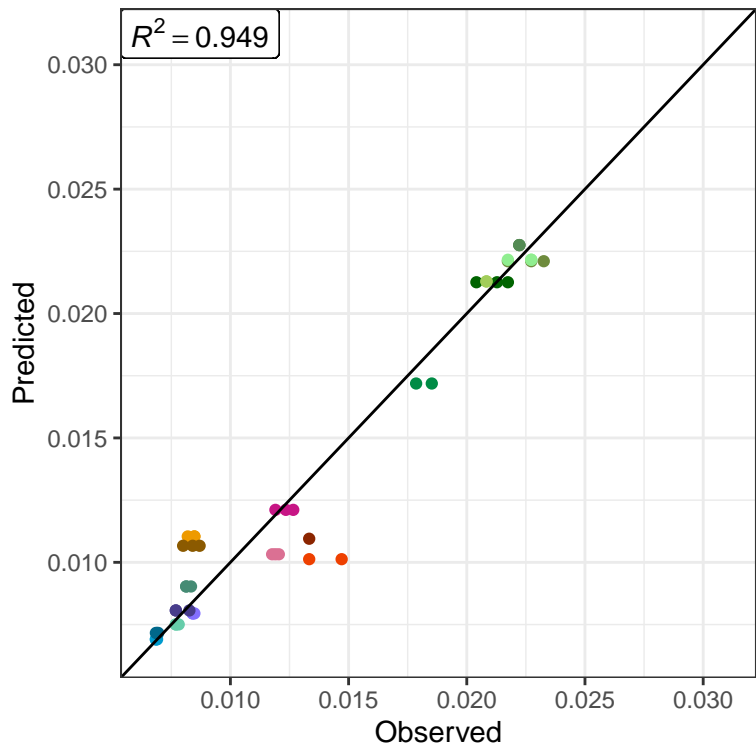

Scatter plot showing Predicted values (Y-axis) versus Observed values (X-axis) for the variable 'number'. The plot includes a diagonal line representing the identity line ( $y = x$ ). The coefficient of determination is  $R^2 = 0.947$ , indicating a very strong positive correlation. Data points are colored by density, with blue representing low density and red representing high density. The points are tightly clustered around the identity line, suggesting high predictive accuracy.

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 150. The y-axis is labeled 'Predicted' and ranges from 0 to 150. A solid black diagonal line represents the line of perfect agreement (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.889$ .

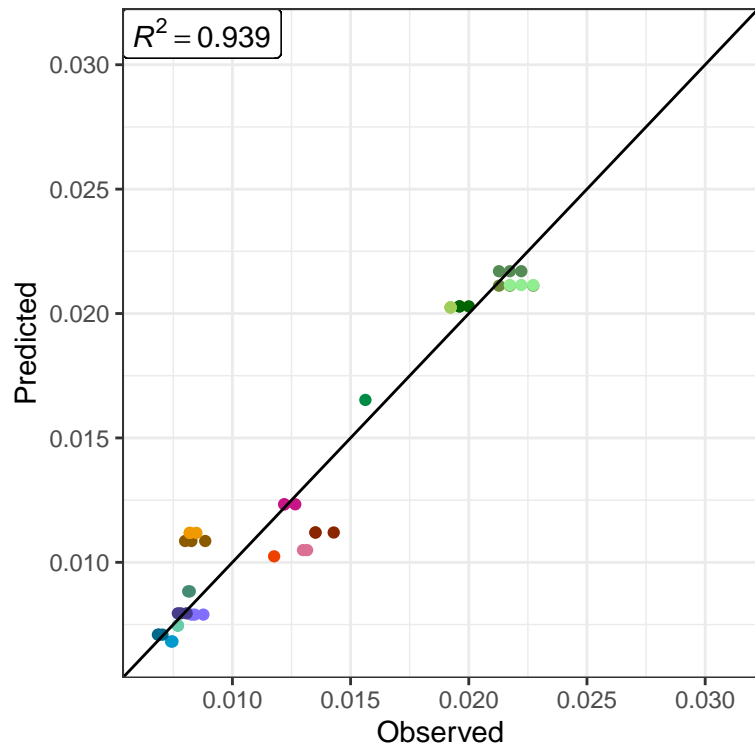

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black line represents the identity line (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.941$ .

A scatter plot showing the relationship between Observed and Predicted values. The x-axis is labeled 'Observed' and ranges from 0 to 150. The y-axis is labeled 'Predicted' and ranges from 0 to 150. A diagonal line represents the identity line (y=x). The coefficient of determination is  $R^2 = 0.925$ . Data points are colored by density, with a color scale from dark green (low density) to dark blue (high density). The points are tightly clustered around the identity line, indicating a strong positive correlation.

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black diagonal line represents the identity line (y=x). The data points are colored circles, mostly clustered along the diagonal line, indicating high predictive accuracy. The coefficient of determination is  $R^2 = 0.953$ , displayed in the top left corner.

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and ranges from 0 to 150. The y-axis is labeled 'Predicted' and ranges from 0 to 150. A diagonal line represents the identity line (y=x). The data points are colored by density, with a color bar on the right indicating values from 0.00 (dark blue) to 0.08 (dark red). The coefficient of determination is  $R^2 = 0.896$ .

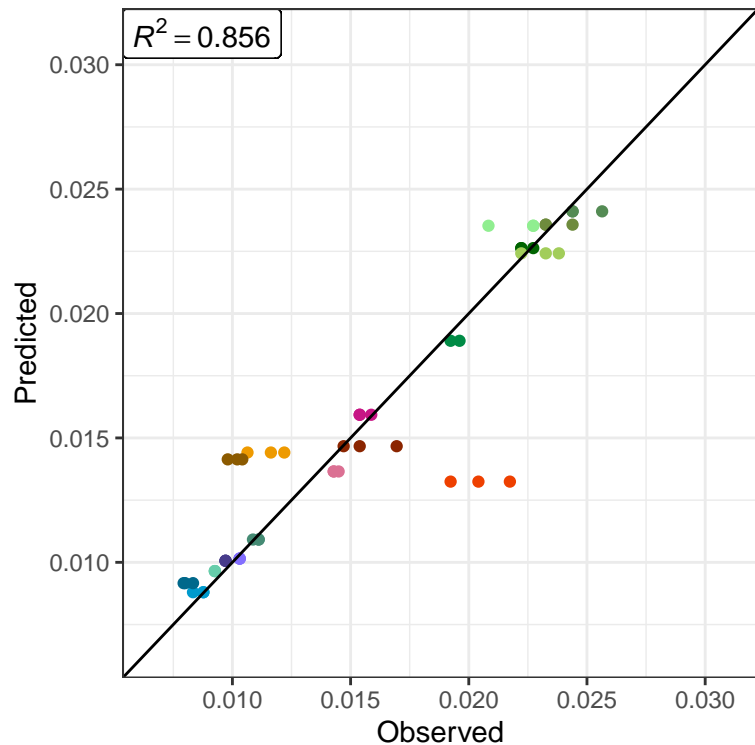

A scatter plot showing the relationship between Predicted and Observed values. The x-axis is labeled 'Observed' and the y-axis is labeled 'Predicted'. Both axes range from 0.005 to 0.035. A solid black diagonal line represents the identity line (y=x). The data points are colored and clustered, showing a strong positive correlation. The coefficient of determination is  $R^2 = 0.957$ .
